score is 18 / 27

Improved Classifier :

In my new and improved classifier , I have reduced the hashtable size to 100 and changed the weighting of the values to $(\text{values} * (\text{weight} * \text{values} / \text{mean}))$. Now this is a type of variable weightage to the values . This helps me improve the efficiency to 18/27 classified.

Why is it performing better :

I feel the larger the size the performance will go down since if the hashtable is larger then there will be less collisions of hashes for 2 different words (while in the latter case of smaller hashtable where for (%size) of 2 different words may still lead to the same value). So we would be spreading the hits over a larger range and thus the weights calculated would accordingly reduce. Thus I tried reducing the hashtable size to this value. If I do not do that , just increase the hashtable size, then there is not much change in the values obtained. In fact the efficiency reduces.

Appendix :

Results of Experiments with testlist2.txt ::

python classifynews1.py goodlist2.txt badlist2.txt testlist2.txt
